EVOLVER BACKGROUND

Evolver was established nearly twenty years ago as an IT infrastructure company that expanded into eDiscovery to support our clients' 25 TB plus complex projects. Since then, we have created unique workflows and specialized native redaction applications. Evolver is a leader in legal technology from installing infrastructure to finding ways to make eDiscovery applications run better, faster, and cheaper.

Cloud Expertise

We are the only legal services company that has installed a variety of eDiscovery applications on the public cloud and supports other service providers' infrastructures.

We are also the only service provider that Government agencies utilize to design their cloud implementation for their eDiscovery applications.

EVOLVER'S TEAM

The profile of our project management team includes professionals that have extensive experience at both law firms and corporations, running eDiscovery and litigation support departments. Evolver's project managers are certified in RCA, RRA, and/or RAS or in the process of obtaining these certifications.

Our data processing team has worked in the eDiscovery industry for over ten years with computer science degrees and are well versed in a variety of applications.

END-TO-END EDRM SUPPORT

Evolver offers true end to end support and customized solutions when working within the EDRM Module.

Evolver's workflow is built on a partnership between the project management team and the client. Our project management team strives to understand your case and helps you develop solutions to reduce data collection, processing, and review.

We leverage the industry's best applications, as well as our custom solutions, to ultimately reduce client review and native redactions. Our unique client support system provides the best eDiscovery service at below industry pricing.

TECHNICAL CAPABILITIES

Evolver Legal Services has technical expertise in legal cybersecurity, information governance, data identification, forensics, legal hold, preservation and collection, pre-data filtering, processing, analytics, post data filtering, searching, native redaction and unique production request capabilities.

Partnership Approach

Evolver is not just interested in collecting all of your client's data and pushing it through to review. We strive to build a partnership, where we learn all about your client's case and help you determine where and what data should be collected and how best to pre-filter it before uploading into our review platform.

Analytics

Once in our review platform, we run analytics such as: categorize, near de-duplicate, clustering, email thread, language identification, repeated content filtering, similar document identification, and domain identification, all at no additional cost to the client. This alone can save you and your clients thousands of dollars in processing, searching and review costs.

Finding all Relevant Data

Once the data is uploaded, our project managers work with you to find the best ways to leverage technology to identify all of the relevant data through the use of keyword searching and / or technology assist review. Once again we do not charge for the use of technology to help identify your relevant data.

Specialty with Native Files

Should your case require the identification of key words, PII/ PHI, or redaction of the same search term(s) across all native file types, Evolver utilizes a full native redaction application called 4iG. It offers de-duplication with the ability to search, identify, and redact all privileged data across all unique records. All productions are in native format; you no longer need to tiff or pdf before, during, or after the redaction process. This tool works directly with Relativity or as a standalone application.
